- Download Kit

Backend

Module Level Management

Administrator Function

This module comprises of 7(seven) levels. Each level further contains another level till the last level. These levels were introduced to maintain the documents as well as the links in the level tree.

This module allows Super Admin to view, edit and delete any Level link name and it's content (if any). If Super Admin deletes any Level1 link, all the records which contains this Level1 link will be deleted throughout the website. Also, all the sub level link and their content will also get deleted throughout the website.

User Function

The user will be clicking on a particular level to view the further level contained in it with the documents/ links contained in it.

Module Country Management

Administrator Function

Through this module, Super Admin can add country name, country flag, admin name of that country and password of the admin. All the Active countries means, they have content for that country in National section, while Inactive country means their may be other information for that country (e.g. News, Opportunity, Events etc.). Admin created through this module would be able to manage content for their respective countries only.

Whenever a new country is being created, it will create a folder with country name and move a redirection file in this folder. When Admin of that country will hit the URL like (<http://www.business-asia.net/admin/<countryname>>) it will automatically redirect it to Login screen of Administrator.

User Function

The user will be able to view the countries on the web page of the website in National section.
